

SUNDARA RENEWABLES LTD

Climate-Related Financial Disclosures — FY2025

Prepared in reference to the RBI Draft Disclosure Framework on Climate-related Financial Risks, 2024 (Governance, Strategy, Risk Management, Metrics and Targets)

This is a synthetic, fictional report generated for demonstration purposes only. It does not represent any real company, and all figures and disclosures herein are illustrative.

1. Governance

Sundara Renewables Ltd's Board of Directors holds ultimate accountability for climate-related governance. A dedicated Board Risk Committee provides oversight of climate governance matters, meeting quarterly to review progress against the company's climate strategy. The governance structure integrates climate considerations into existing risk oversight processes, with senior management responsible for day-to-day implementation and reporting to the Board.

2. Strategy

The company's climate strategy centers on a net zero transition plan targeting 2040, supported by phased decarbonization milestones across our manufacturing and logistics operations. We conduct scenario analysis using both a 1.5°C and a current-policies climate scenario to stress-test our business strategy against physical and transition risk pathways. Climate opportunities, including expansion into renewable energy components, are assessed alongside risks as part of annual strategic planning.

3. Risk Management

Our risk management process begins with systematic risk identification across our value chain, followed by a structured risk assessment covering both physical risk (flood and heat exposure at manufacturing sites) and transition risk (carbon pricing exposure, shifting regulatory requirements). A materiality assessment conducted in FY24 informed our risk mitigation priorities, which are now integrated into the enterprise risk management framework alongside financial and operational risks.

4. Metrics and Targets

We report Scope 1, Scope 2, and Scope 3 GHG emissions annually, independently verified by a third party. Our carbon intensity has declined 18% since the FY21 baseline. Sustainability metrics tracked include water withdrawal, renewable energy share, and financed emissions across our lending-adjacent operations. We have adopted a science-based target aligned with a 1.5°C pathway, submitted for validation in FY25.
